

## INSTALLATION INSTRUCTIONS

# NextFlex Manifold Heaters

# Nextflex heaters are simple and efficient

## Simple to Measure

Nextflex heaters do not expand in length during installation as other flexible heaters do. If you do not have a drawing available, the following method accurately measures groove length.

Push a common outdoor extension cord or rope into the groove.

Mark the entry and exit points of the groove.

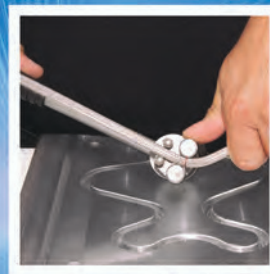

Remove the extension cord or rope and measure the straight length in millimeters.

Your Nextflex length will be your measurement in millimeters rounded up to the next 50mm increment. Example: Measured length of 910mm equals Nextflex length of 950mm

## Efficient to Install

Nextflex tools reduce installation time and eliminate the need for additional retention methods.

Form the first bend at center location prior to striking.

Making sure heater is directly above the groove, strike with Teflon<sup>®</sup> side of Nextflex forming tool. One hard strike is better than two soft ones.

When bending, make sure the Nextflex tool handle is parallel with the uninstalled Nextflex. This puts the minimum bending radius protection in the correct position.

Strike the Nextflex staking tool hard every 1" (~25mm). This creates a firmly seated heater with excellent heat transfer.
